Mr.	O. NOUALI	Maitre de recherche, CERIST	Examinateur

# Abstract

An ad-hoc network is a collection of mobile nodes forming a temporary network without any form of centralized administration or predefined infrastructure. In such a network, nodes move freely and their batteries drain out quickly. These lead to frequent network partitions, which may significantly degrade data and service availability. In such circumstances, replicating data or services at multiple nodes may improve data availability and response time.

In this thesis<sup>1</sup>, we propose six localized replication protocols for mobile ad-hoc networks, where each node can make decision based only on the information from nodes within a constant hop distance. Network partitioning, energy consumption, and scalability are the three major issues that are considered in the design of these protocols. We first propose two partition prediction algorithms, the first one is for a single topology change and the second one is for concurrent topology changes. The algorithms can determine the time at which network partitioning might occur and replicate data items and services beforehand. We then propose three location-based data replication protocols that can achieve a good balance between scalability and availability. The last protocol we propose is based on clustering approach, where each node can send update and query messages to a cluster-head node that is within a constant hop distance.

Our simulation results and analytical studies show that the proposed replication protocols experience low cost, high data and service availability, and high data accuracy.

**Keywords:** localized replication, location-based protocol, partition prediction algorithm, availability, accuracy, scalability.

# Acknowledgements

I would like to thank my advisor, Prof. Nadjib Badache, for his guidance and support through the long march of my studies and research, and for providing me with the opportunity to attain this degree.

I would also like to thank Professors Mohamed Ahmed-Nacer, Aicha Mokhtari, Abdelmadjid Bouabdallah, Mahmoud Boufaida, and Doctor Omar Nouali for agreeing to serve on my thesis committee.

Visiting University of Compiegne was an educating experience for me. For that I thank Professor Abdelmadjid Bouabdallah who made my visits possible, and was always willing to contribute his valuable advice to my research.

Many thanks to all the colleagues and friends with whom I shared a laboratory, especially the head of my laboratory at CERIST research center, Mrs. Hassina Aliane for the support and help she has provided.

I would like to take this opportunity to thank my office-mates, both past and present, for providing me with a friendly and enjoyable work environment. My officemates included: Djamel Djenouri, Lyes Khelladi, Mehdi Chelbabi, and Hichem Abdellah-Hadj.

Finally, I am immensely indebted to my parents, my brothers, and my sisters for their support throughout my everlasting studies.
